

Front View:

Current Limit can be modified with a precision trim-pot.

Just like the volume control on a radio, if you turn clock-wise its getting louder (more current) , and if you turn anti-clockwise, you will get less current.

The precision trim-pot has 24 full revolutions and the set range is about + / - 50% of rated current.

As you turn the pot to either end of the set-range you will feel a clutch-action resistance and hear a click sound.
